

Can I have RDNS added to my VPS?

What is RDNS?

Reverse DNS (rDNS or RDNS) is a Domain Name Service (DNS) lookup of a domain name from an IP address. A regular DNS request would resolve an IP address given a domain name; hence the name “reverse.”

The Domain Name System (DNS) is the phonebook of the Internet. We access information online through domain names, like google.com. DNS translates domain names to IP addresses so browsers can load the website onto your screen.

Can I have RDNS enabled for my service?

For VPS we currently do not have that option available. RDNS is currently only available for our **Dedicated Servers**.
